FIG. 10

Anthrax

Characteristics

Anthrax is a zoonotic disease caused by *Bacillus anthracis*. Under natural conditions, human infected animals or contaminated animal products. Human anthrax is usually manifested attack with anthrax spores delivered by aerosol would cause inhalation anthrax, an extrac disease. Since anthrax is a zoonotic disease, deaths in cattle and sheep coincident with attack.

Clinical Features

The disease begins after an incubation period varying from 1-6 days, presumably depend Onset is gradual and nonspecific, with fever, malaise, and fatigue, sometimes in associat chest discomfort. In some cases, there may be a short period of improvement. The initial abrupt development of severe respiratory distress with dyspnea, diaphoresis, stridor, and evidence of pleural effusions, edema of the chest wall, and meningitis. Shock and sudden respiratory symptom and fever onset.

Vaccine

A licensed, formalin-inactivated cellular supernatant vaccine comprising the B, anthracis be effective in preventing inhalation anthrax. Antibody against protective antigen develop 100% after 12-month dose. The vaccine should be stored at refrigerator temperature (no

Antibiotics

If a biological weapon attack is imminent insert or cases have just been diagnosed prop recommended. Effectiveness of antibiotic use will depend on how early treatment is start
